

A Database of the Zodiac

Designed by
Reyhan Ayhan

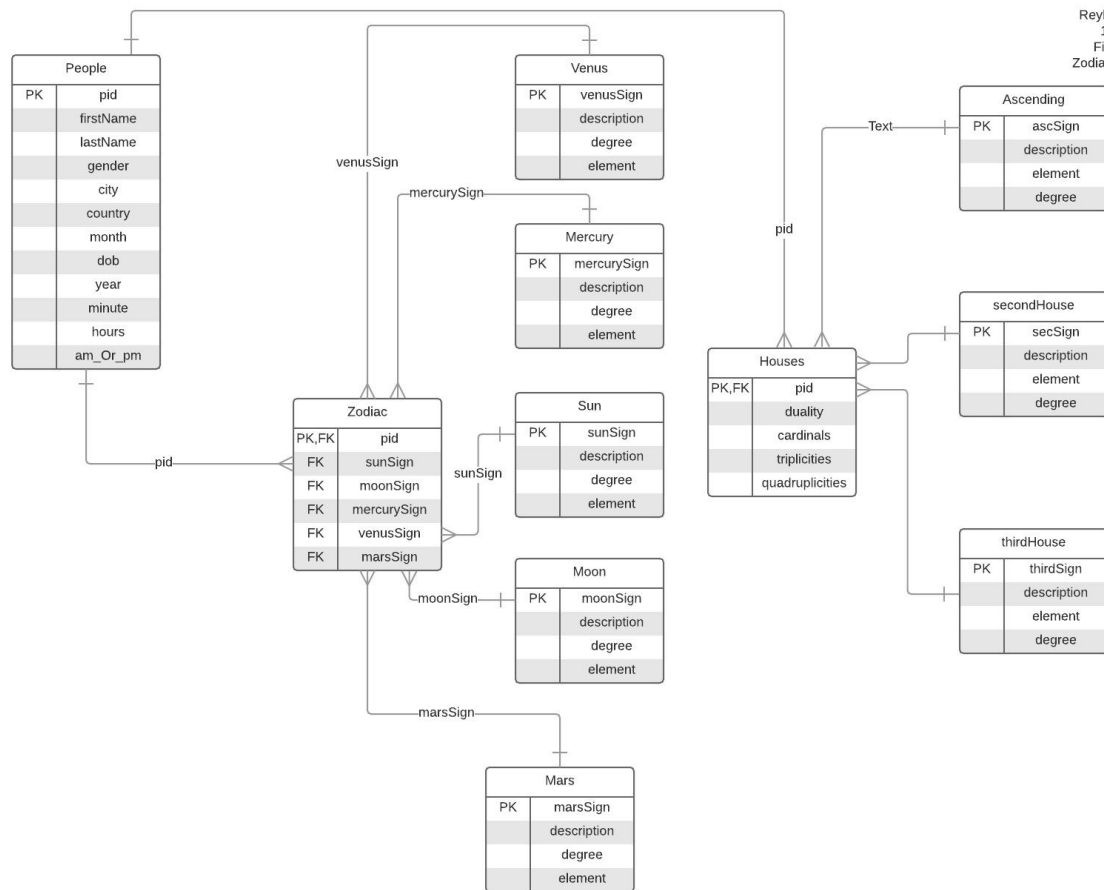

Table of Contents

Executive Summary

With various conversations on whether or not astrology is fan or fiction, it is still something found as a form of comfort and guidance to millions of people around the world. Through “universal powers”, astrology has become a well developed science and this database allows to understand, to a little more than the most basic level, as to what one’s natal chart (otherwise known as a birth chart) could potentially look like based on a variety of factors relating to one’s birth and excludes all of one’s upbringing.

To introduce the Zodiac Database, an entity relationship diagram will demonstrate the relationship between the tables that exist within this database and what key factors each table will consist of. The diagram is then followed by the details of how each of the database tables were developed. Each table will be demonstrated using sample data. The purpose of the suggested database user roles will be explained. To further portray the data integrity of the database, triggers will be shown within the presentation. Sample reports will be also be shown to show how information can be retrieved. Details about the process of implementation, any known problems, and facts that could be changed in the database for the future.
